SAFE-T TECH INTERNATIONAL · SIALKOT, PAKISTAN

Third-Party Inspection Services

Your eyes on the factory floor — anywhere in Pakistan.

Portfolio 2026

Independent inspection for buyers sourcing from Pakistan — verified against your approved sample, documented with photographs, reported before you pay or ship.

ABOUT US

Inspection by People Who Manufacture

Safe-T TECH International — Sialkot, Pakistan

Safe-T TECH International is a garment manufacturer based in **Sialkot, Pakistan** — one of the country's great production hubs. Alongside our own manufacturing, we provide **independent third-party inspection services** to overseas buyers who place orders with factories anywhere in Pakistan.

The problem we solve is simple. You order from a factory thousands of miles away, and until the container arrives you cannot truly know: Is the order complete? Was it made exactly as per your approved sample? Are there defects you will only discover when it is too late to fix them?

Our surveyor goes to the factory **on your behalf** — at the start of production, during production, on completion, or at container loading — verifies your order against your approved sample and specifications, photographs the goods, and sends you a clear written report **before you release payment or shipment**.

Because we manufacture garments ourselves, our inspectors know production from the inside: stitching, fabric weight and shade, trims, measurements and packing. We report what we find — factually, with photo evidence — whether the result is a pass or a fail.

One partner, two strengths: the same team that inspects orders across Pakistan also manufactures sportswear, fashion and uniforms in Sialkot — so when a buyer's factory falls short, we understand exactly why, and what a correct order looks like.

THE FIVE SERVICES

The Inspection Chain

Five checkpoints across the life of your order — book one stage, or cover them all

Every inspection answers a different risk at a different moment. Professional buyers combine the stages; a single well-timed inspection is still far better than none.

Stage	When it happens	What it protects against
1 · Factory Audit	Before your first order is placed	Fake factories, exaggerated capacity, weak quality systems, compliance risk
2 · Initial Production Inspection	Production start — 0 to ~20% complete	Wrong or substandard materials, misunderstood specifications, a bad line setup
3 · During Production Inspection	~20–80% of the order produced	Defects repeated at scale, schedule slippage, quality drifting mid-run
4 · Pre-Shipment Inspection	100% produced, at least 80% packed	Shipping goods that do not match your order — the last checkpoint before payment
5 · Container Loading Supervision	On loading day	Short-loading, swapped goods, a damaged container, seal disputes

How to read this portfolio: the next five pages take each service in turn — what it is, when it happens, what our surveyor checks on site, and what lands in your inbox afterwards.

SERVICE 1 OF 5

Factory Audit

WHEN: Before you place an order with a new supplier — then typically repeated annually

A structured on-site assessment of the factory itself, before money is committed. It answers four questions: does this factory legally exist and is it really a factory — not a trading office? Can it make your product, at your volume, to your standard, on time? Are its quality systems real, or paper-only? And does it meet the labour and safety standards your brand and your market require?

What our auditor checks

- ✓ **Legal existence:** business licence and registration, export licence, the name on the building vs. the name on the documents; claimed certificates sighted as originals and verified
- ✓ **Capacity & capability:** production lines, monthly output, current order-book loading in your shipping month, bottleneck processes, sampling capability
- ✓ **Machinery & equipment:** full machinery list vs. the product claimed, condition and maintenance records, calibration of measuring instruments
- ✓ **Quality system:** incoming-material inspection, in-process and final QC, defect records and corrective action — checked on the floor, not just in the manual
- ✓ **Workforce & facility:** headcount and QC staffing, line layout, warehousing and moisture control, fire safety and exits
- ✓ **Social & ethical scope (on request):** working hours, wages and overtime verified against records, no child or forced labour, health & safety basics

What you receive

A detailed audit report with photographs, findings graded by severity, an overall risk rating — **Approved / Conditionally Approved / Rejected** — and a corrective action plan for the factory where improvement is needed.

SERVICE 2 OF 5

Initial Production Inspection

WHEN: At the start of production — from materials arriving until ~10–20% of the order is produced

The prevention inspection. Our surveyor verifies that the **raw materials, components, machinery, line setup and first finished pieces** all match your order, your approved sample and your specifications — before the bulk of the order is made. A wrong input caught here costs almost nothing to fix; the same fault found at the end can mean reworking the entire lot.

What our surveyor checks

- ✓ **Documents:** the factory holds the correct, current purchase order, tech pack and approved sample — and has genuinely understood them
- ✓ **Raw materials:** type, quantity and quality vs. your specification — is enough of the right material actually in the building, stored dry and segregated?
- ✓ **Fabric verification:** composition, weight (GSM), width and shade — rolls grouped by dye lot so one garment is never cut from two shades
- ✓ **Components & trims:** zips, buttons, labels, hangtags and threads correct in type, colour and content — label wording checked word by word
- ✓ **Machinery & line setup:** the right machines in working order, the line actually assigned to your order, and the factory's in-house QC arrangements
- ✓ **First output:** the first finished and semi-finished pieces compared with your approved sample — style, colour, workmanship, measurements

What you receive

A report with photographs of materials, setup and first pieces, any non-conformities listed, and corrective actions agreed before production continues — delivered the same day or within 24 hours.

SERVICE 3 OF 5

During Production Inspection

WHEN: While production runs — typically ~20–80% of the order produced; long runs may take two or three visits

The mid-course correction. While your order is still being made, our surveyor inspects pieces on the line and in finished stock, so a fault is stopped after hundreds of pieces — not discovered after tens of thousands. Fixing a stitch error at 20% completion is a small rework; discovering it at the end can mean a missed vessel or a shipment of defective goods.

What our surveyor checks

- ✓ **Real production status:** units finished, semi-finished and on the line, counted against the production plan — is the order truly on schedule for your ship date?
- ✓ **Finished & in-line pieces:** compared with your approved sample — appearance, workmanship, measurements across sizes, shade and texture conformity
- ✓ **Consistency:** output compared across production lines and shifts — one line sewing to spec while another drifts is a classic mid-run catch
- ✓ **Materials still being fed in:** no silent substitution of fabric or trims since production started
- ✓ **Trims, labels & assortment:** correct items, placement and content; the size / colour / style mix produced so far vs. your order
- ✓ **Defect trend:** defects classified and counted, the defect rate calculated — and production paused for correction if it exceeds the agreed limit
- ✓ **Packing progress:** packing method, carton quality and shipping marks on units already packed

What you receive

A report covering production status (percentage complete, on schedule or delayed), checklist results, defect counts and rates, measurements and photographs — in time to instruct the factory while correction is still possible.

SERVICE 4 OF 5

Pre-Shipment Inspection

WHEN: Production 100% complete and at least 80% packed — before you release payment or shipment · Also called Final Random Inspection

The most widely used inspection in global sourcing — and your last checkpoint. Our surveyor draws a **random sample from the packed cartons** (never pieces chosen by the factory) and verifies the shipment exactly as it will travel: quantity, quality, specifications, labelling and packing, all against your approved sample.

What our surveyor checks

- ✓ **Quantity & assortment:** total produced and packed vs. your order and packing list; carton count; units per carton; the size / colour / style mix inside
- ✓ **Workmanship:** every sampled piece checked against your approved sample; defects classified Critical / Major / Minor and counted under AQL
- ✓ **Measurements & specifications:** dimensions across all sizes vs. your spec and tolerance table; fabric composition and GSM; shade under standard light
- ✓ **Function & safety:** zips, buttons and snaps tested; seam strength; needle / metal detection — a broken needle in a garment is an automatic fail
- ✓ **Labelling & barcodes:** care, content, size and origin labels correct; every barcode scanned and matched to its SKU
- ✓ **Packaging:** polybags, folding and hangtags per your spec; carton quality and condition; shipping marks matching the documents

What you receive

A detailed report within 24 hours: quantities, the AQL result per defect class, every checkpoint marked conform / non-conform, a defect list, photographs throughout — and a clear verdict: **PASS / FAIL / HOLD**, with our shipment recommendation.

SERVICE 5 OF 5

Container Loading Supervision

WHEN: On loading day — our surveyor witnesses the entire loading of the container, from empty box to applied seal

The final link in the chain. An inspection proves the goods were right when they were checked; loading supervision proves the **right goods, in the right quantity, are what actually left the factory**. Once a container is sealed, a shortage or a swap is only discovered at your destination port — when it is most expensive to resolve.

What our surveyor checks

- ✓ **The empty container:** structure sound, no holes or leaks, doors and gaskets working, interior clean, dry and odour-free — a damp or dirty container is rejected and swapped
- ✓ **Live carton tally:** every carton counted as it is loaded, per style / colour / size assortment, against your packing list and order — counted, never estimated
- ✓ **Carton condition & marks:** no crushed, wet or torn cartons loaded; shipping marks and barcodes verified against the order
- ✓ **Random carton opening:** cartons opened at random to confirm the contents match the labelling — right product, right mix, right units per carton
- ✓ **Loading pattern:** heavy cartons at the bottom, no crushing, even weight distribution, bracing so the load cannot shift in transit; no loading in rain
- ✓ **Supervised sealing:** the high-security seal applied in our surveyor's presence; the **seal number recorded and photographed** and matched to your shipping documents
- ✓ **Moisture protection:** for garments, desiccant protection verified — damp goods in a sealed container develop mould over a long sea voyage

What you receive

A loading report with the verified carton tally, container and seal numbers, and a full time-stamped photo record: empty container, loading stages, random openings, the full load, and the sealed container. Serious problems are alerted to you from on-site immediately — before the container leaves.

HOW QUALITY IS JUDGED

AQL Explained

Statistical sampling under ISO 2859-1 / ANSI-ASQ Z1.4 — the same system used by the world's major inspection firms

Checking every single piece of a large order is impractical, so inspectors worldwide work to **AQL — Acceptable Quality Limit**. A statistically valid random sample stands in for the whole lot; each defect found is classified, and the lot passes only if every class stays within its agreed limit. The levels are fixed with you **before** the inspection, so buyer, factory and inspector all work from the same numbers.

Defect classes

Class	Meaning	Standard AQL
Critical	Dangerous, illegal or unsaleable — a broken needle in a garment, mould, wrong country of origin, a wrong size shipped as another	**0** — zero tolerance; one critical defect fails the inspection
Major	A defect your customer would notice and likely return the item for — measurement outside tolerance, broken stitching, a visible stain, a wrong label	**2.5**
Minor	A small cosmetic flaw unlikely to cause a return — a loose thread, an untrimmed thread end	**4.0**

How many pieces are inspected? (General Level II)

Order quantity	Pieces inspected	Major 2.5 — accept / reject	Minor 4.0 — accept / reject
281 – 500 pcs	50	3 / 4	5 / 6
501 – 1,200 pcs	80	5 / 6	7 / 8
1,201 – 3,200 pcs	125	7 / 8	10 / 11
3,201 – 10,000 pcs	200	10 / 11	14 / 15
10,001 – 35,000 pcs	315	Per the AQL table	

Worked example: on a 3,000-piece order, our surveyor inspects 125 randomly selected pieces. The shipment passes if it holds no critical defects, no more than 7 major defects and no more than 10 minor ones. Stricter limits (for example Major 1.5 for premium brands) can be agreed in advance.

DELIVERABLES

What You Receive

Every visit ends in evidence — not opinions

In every report

- ✓ A written inspection report for the visit — quantities presented vs. ordered vs. packed
- ✓ Photographs of the goods, workmanship, measurements being taken, packing and labelling
- ✓ Close-up photographs of every defect found
- ✓ The sampling basis and AQL tally, where sampling applies
- ✓ Every checkpoint marked conform / non-conform

A decision you can act on

- ✓ A clear overall result: **PASS / FAIL / HOLD**
- ✓ A shipment recommendation — release, rework and re-inspect, or reject
- ✓ Corrective actions for the factory, agreed on site
- ✓ Delivery the same day or within 24 hours — before you pay or ship
- ✓ For loading supervision: verified container and seal numbers with photographs

Why timing matters: the report reaches you while the goods are still at the factory — the one moment when rework is cheapest, a shortage can still be completed, and your balance payment is still in your hands.

THE PROCESS

How It Works

Three steps between you and a verified order

Step 1 — Book. Send us the factory name and address, your order details, and your approved sample or specification sheet. Tell us the stage you want covered — start, during, completion, or loading.

Step 2 — We visit. Our surveyor attends the factory at the agreed stage, works through the checklist for that inspection type, photographs everything, and agrees any corrective actions on site.

Step 3 — You decide. You receive the photo-documented report with a clear pass / fail conclusion, and release payment or shipment with confidence — or hold it, with evidence, until the factory corrects the problem.

Coverage — all over Pakistan

- ✓ Sialkot · Lahore · Faisalabad
- ✓ Karachi · Multan · Gujranwala
- ✓ And production units beyond the main hubs

Sectors we inspect

- ✓ Garments & apparel
- ✓ Textiles & home textiles
- ✓ Sportswear & sports goods
- ✓ Leather goods & general merchandise

WHY SAFE-T TECH

Why Buyers Use Us

Independent eyes, a manufacturer's knowledge

- ✓ **Independent and neutral.** We are not the factory making your order, and we have no interest in its result. We report what we find — with photographs — whether it is a pass or a fail.
- ✓ **Garment-industry specialists.** We manufacture sportswear, fashion and uniforms ourselves. Our surveyors know what correct stitching, GSM, shade continuity and packing actually look like — because they check them on our own lines every week.
- ✓ **Evidence, not assurances.** Every claim in our reports is backed by a photograph, a count or a measurement you can verify yourself.
- ✓ **Pakistan-wide, without hub surcharges.** The global inspection firms price around a few hub cities and charge extra to travel beyond them. Our surveyors are based in Pakistan's manufacturing heartland and cover the whole country.
- ✓ **One relationship, full chain.** Audit, in-production checks, final inspection and loading supervision from a single partner who knows your standards from one order to the next.

The risk is real: international quality data consistently shows that roughly **one in five garment inspections worldwide fails** the buyer's agreed specification. Buyers who inspect are not being cautious — they are being accurate about the odds, on orders worth far more than an inspection.

RECOMMENDED COMBINATIONS

Inspection Packages

Match the coverage to the risk of the order

No two orders carry the same risk. These are the combinations experienced buyers choose, depending on the factory, the product and the value at stake:

Your situation	Recommended coverage
New factory, never ordered before	Factory Audit → Initial Production Inspection → Pre-Shipment Inspection, with Container Loading Supervision on loading day
Known factory, first order of a new or complex style	Initial Production Inspection or an early During Production Inspection → Pre-Shipment Inspection
Repeat order, trusted factory	Pre-Shipment Inspection on every shipment; Container Loading Supervision for high-value containers
Large order, tight deadline	During Production Inspection at ~20% and ~60% → Pre-Shipment Inspection → Container Loading Supervision
High-value container, or payment by letter of credit	Pre-Shipment Inspection + Container Loading Supervision — full coverage from packed goods to sealed container

Not sure which combination fits your next order? Send us the factory, the product and the quantity — we will recommend the coverage honestly, including when a single inspection is enough.

Charges: inspection charges depend on the type of inspection, the factory location and the size of the order, and are **quoted per assignment** before we visit. Contact us on WhatsApp or email with your factory's city and order details for a quote.

Book an Inspection

Tell us the factory, the product and the stage you want covered — we will confirm availability and quote the assignment.
